terminux

Work on multiple projects, one at a time.

A terminal for macOS, Linux and Windows. A workspace for each project, its shells in tabs, and everything where you left it.

Abilian · terminux.lab.abilian.com

TODAY

Six projects, a dozen terminal windows

Which window?

Each project has its server, its tests and a half-typed command, scattered by mid-afternoon.

Is it done yet?

The build finished ten minutes ago, in a window you haven't looked at.

Gone on restart

Quit the terminal and the layout, the directories and the output go with it.

terminux gives each project a home of its own, so you can switch between them without losing track.

WORKSPACES

A workspace for each project

Its own tabs

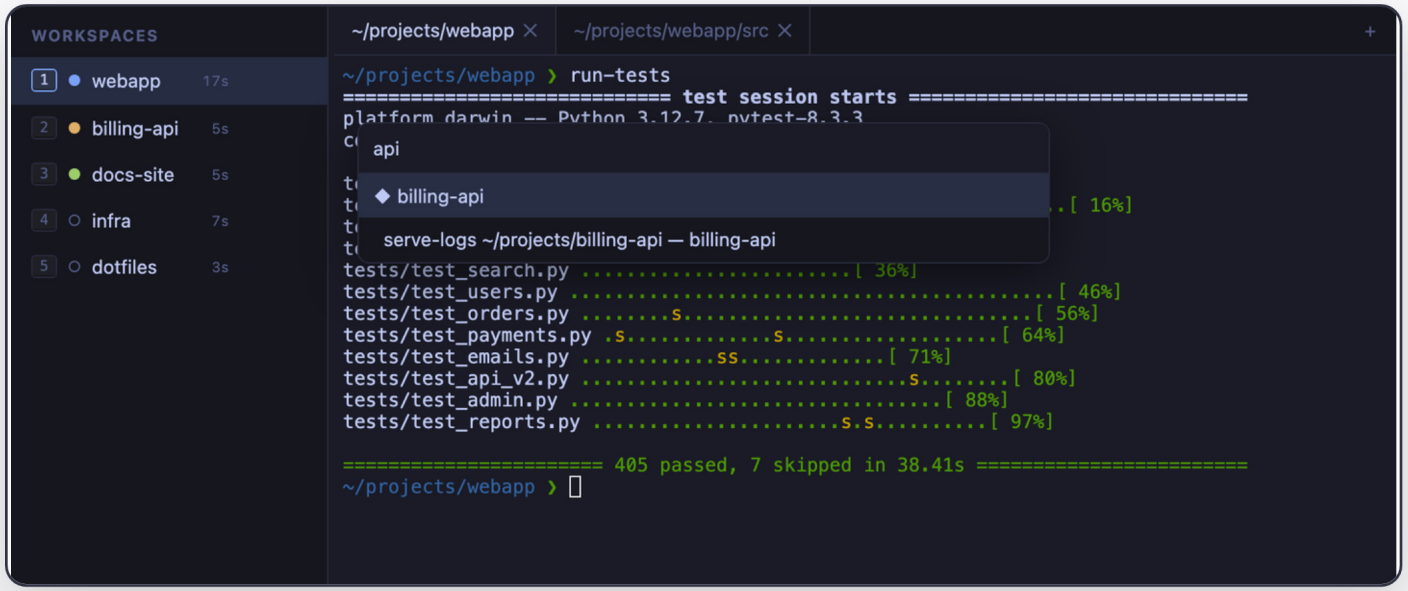

Real shells, and a name that follows the project's directory.

A light for each

Amber while a task runs, green once it's done and you were elsewhere.

Back after a restart

Tabs, directories and scrollback return, with fresh shells.

REMOTE ACCESS

Your shells can live on another machine

On the server

`terminux --server -d`

prints a URL with a lasting access code

→

Through SSH

`ssh -L 8443:…`

or straight in, on a trusted network

→

On your laptop

`terminux --connect`

the usual window, with the server's shells

Close the lid, change networks, come back tomorrow: builds kept going, and the terminals reconnect and repaint what happened.

BY DESIGN

A terminal, and nothing else

Reliable

A stuck program can't freeze the app. Terminals reconnect on their own, and saves are atomic.

Local

No account, no telemetry. Your state lives in readable files on your own machine.

Small

A Python backend owns the shells; an xterm.js UI runs in the system's webview. No AI, no editor.

Open

Free software under the Apache 2.0 license, made by Abilian in France.

AVAILABLE NOW

Try it today

macOS · Linux · Windows

```
uvx terminux
uv tool install terminux
```

The first line tries it without installing; the second installs it.
